Elasticsearch Setup

Andrea Tocchetti
andrea.tocchetti@polimi.it

Elasticsearch Setup

- Download Elasticsearch
- Extract the files from the downloaded zip
- Setup an environment variable named “ES_JAVA_HOME” with the path to your java version (elasticsearch requires a version of java 8 or later, **java 11** is recommended)
  - You should already have java installed, otherwise download it here
- Open a new terminal
- Move to the extracted elasticsearch folder
- Move into the bin folder
- Run **elasticsearch** (Mac or Unix) or **elasticsearch.bat** (Windows)
- Open your browser
- In the url field, type **localhost:9200** and press enter
- The informations about Elasticsearch should appear on the screen

Kibana Setup

- Download Kibana
- Extract the files from the downloaded zip
- Open a new terminal
- Move to the extracted kibana folder
- Move into the bin folder
- Run **kibana** (Mac or Unix) or **kibana .bat** (Windows)
    - Keep the Elasticsearch terminal open, otherwise Kibana won't run
- Open your browser
- In the url field, type **localhost:5601** and press enter
- The basic interface of Kibana should appear on the screen

Data Import

- Download the data
- In Kibana, press the “Add data” button
- Then, press the “Upload file”
- Drag and drop the data file you downloaded
- On the bottom left, press “Import”
- Name your index “**new_york_crashes**” and press “Import” again
  - It may take a while to upload the file.
- Open the menu on the left, and press “Discover”
- On the top right, change the time field to display the last 3 years
- Press “Update”
- The interface should now display the uploaded data
